WHAT IS TRADING?

Trading involves buying and selling financial assets such as stocks, currencies, and commodities in order to profit from price changes. The share market is where these transactions take place, allowing individuals to own small portions of companies and participate in their growth. Trading can be short-term or long-term, depending on the strategy used, and requires knowledge, patience, and strong risk management skills.

Trading is not just about making quick money—it's about understanding how markets behave. Prices in the market move due to supply and demand, global news, economic conditions, and investor sentiment. A skilled trader learns to read these signals and act accordingly.

There are two major approaches traders rely on. Technical analysis focuses on charts, patterns, and indicators to predict price movements. On the other hand, fundamental analysis looks at a company's financial health, news, and overall economic factors. Consistency is key in trading. Successful traders follow a strategy, manage risks carefully, and avoid emotional decisions. Without proper discipline, even the best strategies can fail.

Risk management plays a crucial role. Setting stop-loss levels, controlling position sizes, and avoiding overtrading are essential habits every trader must develop to survive in the long run.
